

# Lexitoshi Pool

## What is the Share Value Reduction?

By default, the Share Value Reduction is set to 50% per block. if pool on current round does not find a block, miners shares are keep (up to 50 blocks), but their value is reduced by 50% everytime we dont found a block. when pool has positive balance, all share are summed up to block# where payment will be made, and burst payment are made proportional to total share miners own up to this time
